1.0 Abstract

With the introduction of mandatory sheep eID requirements in NSW, all sheep and goats are to be electronically identified (eID) and recorded in the National Livestock Identification System (NLIS) database. As a result our organisation undertook an evaluation of the BlueTrace eID readers. The project was implemented in stages at our Dubbo processing facility. In Stage 1, the performance of BlueTrace panel readers was assessed on the slaughter floor, focusing on scan accuracy and throughput rates. Based on these findings, Stage 2 involved refinement of panel placement and configuration to optimise performance. Stage 3 explored the integration of back-office software solutions to enhance data handling and traceability.

Internal benchmarking demonstrated scan rates that exceeded 90% using wand verification, while data reported to NLIS consistently averaged 95% accuracy—significantly higher than the industry average of 50%, as confirmed by Department of Primary Industries (DPI). This was done by crosschecking sale yard scans with our daily uploads. These results highlight the potential of BlueTrace technology to deliver industry-leading compliance results with current eID requirements.

2.0 Executive summary

This project was undertaken to assess the performance of BlueTrace electronic identification (eID) readers in a commercial sheep processing facility. As an industry there is an interest in such assessment as mandates have come into force.

The target audience of this report includes industry bodies such as AMPC, Department of Primary Industries (DPI) and other processors - key stakeholders who will be directly impacted by these regulatory changes. The DPI required reliable data to evaluate the BlueTrace system against other available tag technologies, such as Allflex, in preparation for broad industry adoption. The findings of this research will inform the DPI's overarching evaluation of traceability tools and provide processors and producers with confidence in the effectiveness and compliance-readiness of BlueTrace technology.

The objective was to evaluate the scanning accuracy of the BlueTrace panels on the slaughter floor. Data accuracy was verified internally using wand scanning and compared with NLIS uploads. Over the last 2.5 months, we proactively refined the placement of the panels and any potential interference. This meant we were able to improve our scan rates from 80% to 95%.

This trial provides a proven, high-performing eID scanning solution to assist with compliance of current mandates.

3.0 Introduction

This project was to assist with the roll out of mandatory eID requirements, requiring all animals to be tagged with an NLIS-approved device and recorded in the NLIS database. This mandate was intended to enhance national traceability capabilities for biosecurity, market access, and food safety. However, as the transition progresses, significant challenges have emerged at the processing level—particularly relating to the management of untagged or incorrectly tagged animals arriving at abattoirs. Despite issues surrounding current regulatory framework, we wanted to ensure the BlueTrace technology installed on our slaughter floor was working to the best of its ability and consistently scanned those animals tagged correctly.

4.0 Project objectives

4.1 Determine Efficiency and Capacity of BlueTrace RFID panels

- Determine efficiency and capacity of BlueTrace RFID panels to scan sheep eID on the slaughter floor
- Identify potential interference, including environmental conditions or nearby electrical equipment causing noise
- Develop strategies for identification of no-tags and minimise instances of no-reads

4.2 Evaluate Tag Compatibility

- Evaluate readability, reliability and performance differences between four (4) assorted brands of eID sheep ear tags currently certified under the Integrity Systems Company certification when using BlueTrace eID panels (Overarching DPI project)
- Determine if location of tag within the ear has an impact on the panel eID reading performance.

4.3 Integration of Data with Production Systems

- To integrate this information into the existing production systems for use in the production process, if possible.

4.4 Technical Report

- Deliver a technical report outlining performance and functionality of the BlueTrace eID equipment.

5.0 Methodology

BlueTrace EID Panel Evaluation

- Assessment was conducted to determine best placement of BlueTrace Panels on slaughter floor. Robust work was completed to understand potential interference that could impact the scan-ability.
- Chain speed was taken into consideration and variability in livestock size.
- Panel height and positioning was assessed and modified as required.
- The scan accuracy of the panel was assessed by;
 - Picking mobs that were tagged and scanning roughly 200 head with hand wand (taking note of start time and RFID number)
 - Retrieving data from BlueTrace data system
 - Comparing results from wand and BlueTrace – this comparison allowed the calculation of the percentage of animals successful scanned by Blue Trace (read rate) versus those physically scanned by the wand.
 - This was replicated over a 3 month period, whilst positioning of the panels were refined.

System Integration

- Investigate potential integration into existing production systems
- Scope the potential benefit of including a mob change button that would allow for differentiation of RFIDs between different mobs
- Work with BlueTrace technicians to enable such add-ons

6.0 Results

Read rate of panel was determined by comparing results from BlueTrace with manual wand data, across 4 different sessions. Between each session position was refined. Summary of results below.

DATE	BLUETRACE READ RATE	SAMPLE SIZE (HEAD COUNT)
03/04/25	87%	100
15/04/25	81%	295
16/04/25	95%	400
04/06/25	93%	221

DPI provided below intel to further validate these results. *Fletcher International Export (Dubbo) processing plants panel reader is reading at 90%, this is looking at the NLIS uploads against sale yard scans. The average of the state is just on 50%.*

Regarding, system integration the addition of the mob change button was successful. The identifying number in the system will now increment automatically with the press of the button.

7.0 Discussion

The results of the BlueTrace panel reader trial demonstrate a clear upward trend in read rate performance over the three-month period, with accuracy improving as panel placement and configuration were refined. Early trial dates showed moderate performance (e.g., 81% on 15 April), but later dates reached consistently high read rates above 90%, indicating that optimisation of panel height and alignment played a significant role in maximising scan success across varying carcasses. See final panel/screen placement in Figure 1 and 2 of Appendix 1.

A deeper analysis of missed reads on 15 April revealed that 14 animals required multiple attempts to be scanned manually using a wand. Of these, 8 animals were also missed by the BlueTrace panel. This overlap suggests that certain tags were inherently difficult to read, regardless of the scanning method. This validates that in some cases, read failures are not due to hardware limitations but tag-specific or presentation issues.

Several possible factors were identified as contributing to scan failures:

- **Non reading Tags:** In addition to the large number of untagged animals that arrive at the processing facility, many are tagged but are either difficult to read or cannot be read.
- **Tag placement:** Tags positioned too close to the base of the ear or angled inwards can reduce readability. *(Optimal position seen in Figure 3, Appendix 1)*
- **Carcase positioning:** Deep throat incisions may cause the head to fall further back from the panel scanner, affecting read distance and orientation.
- **Wool interference:** Long wool around the ear may obstruct the signal or reduce tag visibility. *.(Such interference seen in Figure 4, Appendix 1)*
- **Physical obstructions:** The presence of multiple tags in the ear, including visual ID tags, may physically block the EID tag or interfere with the signal.

These observations highlight the complex range of variables that can influence eID scanning performance in commercial settings. While BlueTrace panels proved to be highly effective overall, results also emphasise the importance of factors such as consistent tag application.

8.0 Conclusions

The BlueTrace EID panel reader trial successfully demonstrated that the system can deliver high scan accuracy and operational efficiency within a commercial sheep processing environment. Read rates improved steadily over the course of the project, reaching up to 95% as panel placement was optimised, and consistently outperforming the NSW state average of 50%.

These results, validated by both internal checks and independent DPI assessments, confirm BlueTrace as a viable, high-performing traceability solution.

Importantly, this project also highlighted broader operational realities, including the significant burden placed on processors by outdated legislative requirements and inconsistent upstream compliance with tagging mandates. Despite these limitations, Flechter have demonstrated a strong commitment to traceability, and this project shows that with the right technology in place, industry can meet read rates of 90% +. What requires attention is upstream tagging and scanning.

The results of this project will inform DPI's broader evaluation of eID technologies and also support a case for modernising regulatory approaches, such as introducing virtual tagging, to better reflect operational conditions whilst maintaining traceability standards.

9.0 Recommendations

As per above.

10.0 Project outputs

Hosted Tracy Lamb from DPI to assist with data gathering for overarching evaluation of traceability tools.
